

Highlights of the toolkit for manufacturers of plastic pellets (incl. formulators of master batches and compounds)

It is great that you care about the health of children playing with toys made from your raw materials! You may use this toolkit to understand how sound chemical management can prevent chemicals of concern (CoCs) are contained in toys and cause harm to children. Check out and browse through the various sections, maybe starting with information on what CoCs are [#1.1. Guidance Understanding CoCs](#).

Here are some shortcuts if you have specific issues to address:

- I need to know what legal requirements [#2.1 Guidance How to find legislation on toys](#) apply to toys made from my plastics.
- My information management could be improved, I am always searching for data. I want to have a structured information base [#4.1 Guidance Set up a chemical inventory](#) on what I use and produce.
- There are new legal requirements and I have to stop using a chemical. I need help on what I can use instead [#5.3 Guidance Substitution process](#)
- I don't know what is in the masterbatches I am using. How can I make my supplier tell me [#3.1 Guidance Getting Information on input materials?](#)
- My customers ask me about classification [#1.3 Guidance GHS for begginers](#) – what is it?
